SUMMARY

Backend-focused Software Engineer with 1.5+ years shipping production fintech/insurtech systems on Java, Spring Boot, Kafka, PostgreSQL, and Kubernetes (AWS EKS). Own end-to-end delivery across 8+ services processing millions of transactions for East Africa insurance and payments partners (Jubilee, Prudential, Furaha). Hands-on experience designing agentic/LLM-powered conversational workflows and rapidly cross-training across the full stack (React/Next.js to Spring Boot) within weeks.

EXPERIENCE

Software Engineer | NxtPe

Jan 2025 – Present | Remote

- Own end-to-end backend delivery and drive engineering and architecture strategy across 8+ production services — notification/messaging, loyalty & rewards, offline POS, partner billing — on Java/Spring Boot, PostgreSQL, Kafka, and Kubernetes (AWS EKS), independently shipping 15–20+ PRs to production weekly across parallel workstreams.
- Extended the core multi-channel notification data pipeline (SMS/WhatsApp/push) that aggregates and processes **7.8M+ events** across partner integrations — built the fallback-delivery system for failed sends, DND/opt-out compliance workflows, and Kafka-driven webhook callbacks.
- Designed and led the integration of a third-party insurance policy/contract system — **Jubilee Life Insurance (Uganda)** — now **199,800+ active subscription contracts** and **3M+ notifications delivered** — including the Kora 3.0 mandate-management UI.
- Built core modules of **Intent and Probatas** — NxtPe's configurable application-intake and case-approval system — spanning form/product/payment configuration, a multi-step approval workflow with role-based approval groups, and a Kafka event listener that auto-creates subscription contracts in Recurring on case approval; now handling **5,200+ applications** and **1,900+ approval cases**.
- Core contributor to **Engage**, NxtPe's WhatsApp/SMS conversational platform — built its command/action execution engine, an AI-based conversation-tagging system for support-queue prioritization, and onboarding-automation workflows; now powering **90K+ customer conversations** and **460K+ message exchanges** across partner channels.
- Transitioned from MERN to Java/Spring Boot within weeks of joining — moved from frontend checkout-flow work on **Kora** to owning backend services (**Subscription Benefits, Recurring billing, Partner Gateway routing**) within the same quarter, while continuing to ship React/Next.js UI end-to-end across Kora and partner cockpit panels.
- Own infrastructure changes on the **Kubernetes/EKS** production cluster — editing ingress and NGINX reverse-proxy configs to expose new API routes, diagnosing production incidents in Kafka consumers and pod memory/restarts, and deploying containerized services via Docker Compose and Caddy to standalone EC2 hosts.

Software Engineer Intern | Cosma Beauty

Aug 2024 – Jan 2025 | Bangalore, India

- Built REST APIs in Java (Spring Boot) and Node.js powering appointment scheduling, notifications, and service booking flows.
- Optimized database queries, improving backend response times by **20%**.

Software Engineer Intern | Goformmeet

Mar 2024 – Aug 2024 | Bangalore, India

- Built authentication, booking, and profile modules in Node.js/MongoDB using modular, reusable API design; deployed and scaled the application on AWS.
- Built the customer-facing frontend from scratch in Next.js and TypeScript — including location-based data display, an admin panel, and SEO optimization — using the Shadcn component library.
- Collaborated with design and product teams to scope and implement new features.

EDUCATION

B.Tech, Computer Science (AI & ML) — Geethanjali Institute of Science and Technology
77.74% — First Class with Distinction

Dec 2021 – Jun 2025

SKILLS

Languages & Frameworks: Java, Spring Boot, Python, Node.js, TypeScript, JavaScript (ES6+), React, Next.js

Data & Messaging: PostgreSQL, Redis, MongoDB, Kafka (event-driven architecture)

Cloud & DevOps: AWS (EKS), Kubernetes, Docker, CI/CD (GitHub Actions)

AI/ML: Prompt engineering & structured-output design, LLM-based classification pipelines, RAG/vector-DB (pgvector) architecture

APIs & Architecture: REST APIs, Microservices, Distributed Systems, System Design, Clean Architecture

ACHIEVEMENTS

- Founded the Google Developer Student Club (GDSC) at GIST, organizing hackathons and workshops.
- Ranked 15th in NxtWave's coding challenge (10,000+ participants), earning a fully-sponsored tech trip to Dubai.
